

exact identity: $D_E(\Pi_N \mathcal{F}_N)(\Phi) = 0$
for every history Φ

perturbation $E = (E_k)$
of delayed coupling
 $\pi_N^T E_k = 0, \sum_k E_k = 0$

first moment
 $S_N E = \frac{K}{2\alpha} P_{\perp, N}$
 $\left(\sum_k \theta_k E_k \right) \mathbf{1}$

transverse variation
 $h_E = A_N^{-1} S_N E$

if a heteroclinic defining
function G is available
 $D_E \mu_{C, N} = \delta^3 \Lambda_N(E) + O(\delta^4)$

one merged delay
 $S_N E = 0$

$$\Lambda_N(E) = -\alpha^{-1} \pi_N^T \text{diag}(c_N) h_E$$

linear maps exact; final equality conditional and asymptotic
